The Effects of Saltwater on Moss

Bertie Middle School Student

Introduction
The reason I was interested in this project is because mosses are very small important plants that live in wet areas. After working with the daphnia this year and last year, I learned that salt is a creator of stress. I wondered if it would stress out or kill the moss. I used a greater amount (%) of salt on the mosses than we used with the daphnia experiment.

Research Problem
What is the effect on different salt levels on moss?

Hypothesis
I thought the mosses sprayed with ten percent salt water would die in the first two days. I thought the 2 percent was going to die in a week as also the 5 percent.

Materials and Methods
Materials:
- 2%, 5%, 10% salt water made from Instant Ocean Moss
- Squirt bottles
- Glass bowls for the moss
- Camera
- Saran wrap

Methods
1. Plant the moss in potting soil in a bowl.
2. Take picture before spraying with salt water mixtures
3. Sprayed them 2 times every other day
4. Cover after spraying with saran wrap
5. Take pictures regularly

Results
Comparison of Mosses when sprayed with Different Salt Water Percents

<table>
<thead>
<tr>
<th>Date</th>
<th>2% Salt</th>
<th>5% Salt</th>
<th>10% Salt</th>
</tr>
</thead>
<tbody>
<tr>
<td>4/30/19</td>
<td><img src="image" alt="2% Salt" /></td>
<td><img src="image" alt="5% Salt" /></td>
<td><img src="image" alt="10% Salt" /></td>
</tr>
<tr>
<td>5/15/19</td>
<td><img src="image" alt="2% Salt" /></td>
<td><img src="image" alt="5% Salt" /></td>
<td><img src="image" alt="10% Salt" /></td>
</tr>
</tbody>
</table>

After 2 weeks of spraying, there was not much difference in the color or health of the mosses.

Discussion of Results
There was a small amount of discoloration on one of the mosses that was sprayed with the ten percent salt water. There was no change in the 2 percent or the 5 percent sprayed mosses. I would try to increase the salt percent and also spray more often and with more than 2 sprays to see if there was more stress on the mosses, and I would like to try different mosses. Seawater coming into our marshlands is a problem but mosses may be able to survive very low percentages of seawater.

Conclusion
My hypothesis was not correct because the mosses sprayed at all percents of salt water survived.
