

# Short-Range Outlook for North Carolina

## Week 1:

June 4 to 10, 2026

### Heating Up This Weekend

High pressure along our coastline will raise our high temperatures well into the 90s from Friday through Sunday. A weak cold front moving in by Monday will knock our temperatures back a few degrees, but we'll still be in the upper 80s into early next week.

### Mostly Dry This Week

With high pressure overhead, we'll be sunny and dry this weekend with increased fire danger as afternoon humidity levels drop below 40%. Rain chances will increase along Monday's cold frontal passage, but amounts should generally be less than half an inch.

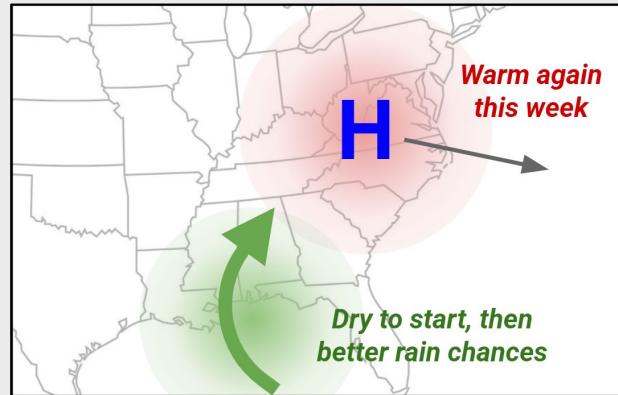

### Forecast Confidence

This is a fairly clear-cut pattern, only somewhat clouded by how widespread any showers and storms will be early next week.

## Week 2:

June 11 to 17, 2026

### Warming Up Again

A new week should bring a similar weather pattern, with high pressure building overhead or just off our coast by next weekend. Expect warm but more humid conditions through much of this week, tempered by any cloud cover and rain showers.

### Dry, Then Daily Showers

As in Week 1, we should get off to a dry start thanks to the high pressure system over us. As that system shifts off to the east, we should eventually see enough moisture moving in from the south to fuel pop-up afternoon showers and thunderstorms.

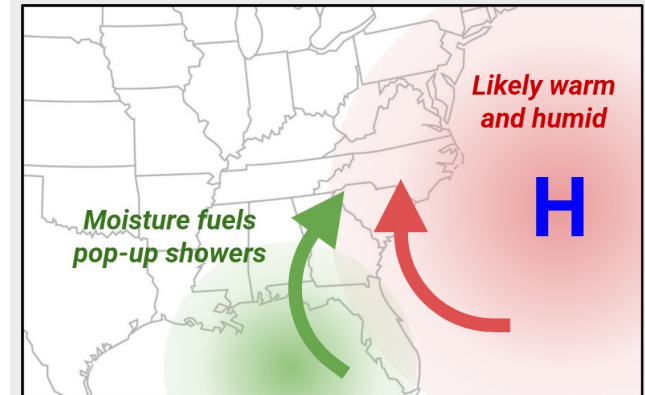

### Forecast Confidence

Any more organized cold fronts or low pressure systems, as some models have shown recently, could bring better rain chances.

## Weeks 3-4:

June 18 to July 1, 2026

### Summer Settles In

The end of June should bring a typical summer-like weather pattern, with the Bermuda high pressure system building offshore and bringing us warm and humid conditions. Our average high temperatures by late June range from the upper 80s to the low 90s.

### Average Rain Chances

While not every day will be wet, the moist southerly circulation around the Bermuda high should favor regular showers and thunderstorms. Also, watch for a potentially active Atlantic early in the hurricane season thanks to the warm water across the basin.

### Forecast Confidence

Given the classic summer pattern, confidence is moderate overall, but it's worth watching this period for any potential changes.
